1 Introduction

1.1. General Description

Pretec high performance SRAM cards conform to the PCMCIA / JEIDA international standard and consist of multiple very low power consumption CMOS SRAM ICs, decoder IC and power control IC mounted on a very thin printed circuit board using surface mounting technology.

With the dual back-up battery design, each SRAM card contains a replaceable but non-rechargeable 3V lithium battery (main battery) and an on-board rechargeable but non-replaceable battery (auxiliary battery) for data retention. This design allows replacement of main battery without data loss for 20 minutes approximately. Digital signals on the BVD1*/BVD2* pins were used to alarm the user whether the main battery should be replaced to prevent the stored data from loss. With the flexible and user-friendly design, both BR2325 and CR2025 can be used as main battery. There is battery case lock system to prevent battery dropping from the card. Also, with the write-protect switch design, data will not be written into the card by accident.

Memory card attribute information represents various attribute information of a card and is stored at EVEN address of an attribute memory space which is enabled by asserting REG* signal. Regarding to the attribute information format, please refer to the PCMCIA 2.0 or JEIDA 4.1 specification. With the flexible design of this series cards, they provide 8K bytes E2PROM available for attribute memory or there is no attribute memory.

1.2. Features

- Interface: PCMCIA / JEIDA standard
- Capacity: 256K bytes ~ 8M bytes
- Data bus selectable: Byte (x8) / word (x16)
- Built-in write protect switch
- Credit card size: 54.0 x 85.6 x 3.3 (mm)
- Fast access time: 120ns (maximum)
- Attribute memory: 8 KB (optional 2KB/0KB by special request)
- Single +5V operating voltage
- Connector type: 2-piece, 2-row, 68 pins
- Battery:
 - Dual back-up battery design
 - Both BR2325 and CR2025 used as main battery
 - Battery voltage detection function
 - Battery case lock system

1.3. Product Number Definition

Note: A/M means attribute memory

1.4. Ordering Information

Commercial Grade: 0°C~+70°C (Data bus 8bit/ 16bit selectable)

2.7. Comments

Stress above those listed under “Absolute Maximum Ratings” may cause permanent damage to the products. These are stress rating only. Functional operation of these products at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability

3.6.4. Battery Voltage Detection

BVD1*/BVD2* pins are used to monitor the voltage of the main battery which should be maintained at 2.65V or greater for data retention. The following table described the main battery status by reading the signals on BVD1*/BVD2* pins.

BVD1*	BVD2*	Main Battery	Comments
H	H	$VBAT \geq 2.65V$	Data retention is OK. Battery is operational
H	L	$2.37V < VBAT < 2.65V$	Data retention is OK. But battery should be replaced.
L	L	$VBAT < 2.37V$	Data integrity is not guaranteed. Battery must be replaced.

Note: if the main battery is removed, BVD1* and BVD2* pins will not function

3.7. Main Battery Specifications

3V Lithium battery

Diameter	Thickness	Brand	Model No.
23.0mm	2.5mm	RAYOVAC	BR2325
		FDK	CR2325
		PANASONIC	BR2325

Recommended parts (Please refer to the table below)

Diameter	Thickness	Brand	Model No.
20.0mm	2.5mm	TOSHIBA	CR2025
		FDK	CR2025
		PANASONIC	CR2025

3.7.1. Data Retention That Without External Power Supply

(Ta=25°C, Humidity=60% R.H.)

Parameter	Memory Size	Memory Back-up time	Units	Condition
Battery Backup Time	256KB	39	Months	Battery backup time is a calculated value and is not guaranteed. This is should not be use to schedule battery recharging (Temp. 25°C)
	512KB	18		
	1MB	18		
	2MB	18		
	4MB	10		
	6MB	7		
	8MB	5		

Note:

Battery Backup time is density and temperature dependent.

For battery back-up time denote using 2325

3.8. Card Detection

CD1*, CD2* pins are used to detect the insertion of the card into the system. When the memory card has been correctly inserted, CD1* and CD2* are detected by the system. The recommended circuit in the system side is shown in figure below.

Figure 9: The Card Detection

3.9. Power-up / Power-down Characteristics

Symbol	Parameter	Min.	Max.	Unit	Condition
Vi(CE)	CE* Signal Level	0	ViMAX ^{*1}	V	$0V \leq VCC < 2.0^{*2}$
		VCC-0.1	ViMAX	V	$2.0 \leq VCC < V_{IH}$
		V _{IH}	ViMAX	V	$V_{IH} \leq VCC$
tsu(VCC)	CE* Setup Time	20	-	ms	10ms (Typ.)
trec(VCC)	CE* Recovery Time	1	-	us	-
Tpr ^{*3}	VCC Rising Time	0.1	300	ms	10% 90% (VCC+5%)
Tpf ^{*3}	VCC Falling Time	3.0	300	ms	90% (VCC-5%) 10%

Note:

1. ViMAX means absolute maximum voltage for input.
2. For the period $0V \leq VCC < 2.0V$, power supply voltage is low, so $0V \sim ViMAX$ is permitted, because the logic for the system interface IC may not be determined.
3. The Tpr and Tpf are defined as "linear waveform" in the period of 10% to 90%. Even if the waveform is not "linear waveform", its rising and falling time must meet this specification.
